SECOND TERM ENGLISH TEST

Part One: Reading

(15 points)

Read the text carefully and do the activities.

In 2013, 42 million children and teenagers were overweight or obese, worldwide and 70 million young children will be overweight or obese by 2025 if current trends continue. Without intervention, overweight infants and young children will likely continue to be overweight during childhood, adolescence and adulthood. Obesity in childhood is associated with a wide range of serious health complications and an increased risk of early start of illnesses, including diabetes and heart disease.

Canada, like many nations, is in the heart of an epidemic of overweight and obesity. There has been a dramatic increase in unhealthy weights in Canada. Childhood overweight and obesity has been rising steadily in Canada in recent years. The combined prevalence of overweight and obesity among those aged 2 to 17 years increased from 15 per cent to 26 per cent. Increases were highest among youth, aged 12 to 17 years, with overweight and obesity more than doubling for **this age group**, from 14 per cent to 29 per cent.

Currently, 59% of adult Canadians are either overweight or obese. Adults **who** have unhealthy weights are at increased risk of heart disease, cancer, strokes and type 2 diabetes. Affected adults may die up to 3 to 7 years earlier than counterparts with a healthy weight.

The total cost of obesity to Canadians was \$4.3 billion. The resulting toll in dollars cost and lives lost is a call for action. Obesity is difficult to reverse and public health measures must include effective prevention beginning in childhood as well as treatment.
